RUBENS- USER'S MANUAL

GENERAL

INTRODUCTION

The present manual contains all information regarding the technical characteristics and the performance of the CNC on the Rubens board. It is designed as a useful guide which can be referred to for a quick understanding and for efficient application of all its functions.

The Rubens CNC is a NUMERICAL CONTROLLER packaged in a metal case for rear-of-panel mounting. It is designed to control up to 4 axes that can be STEPPER, DC or BRUSHLESS motors both in point to point positioning and in linear or circular interpolation. It can handle the machine I/O (16 inputs and 8 outputs) both in sequential mode and as a PLC program (optional). The I/O can be expanded up to 128 inputs and 128 outputs via Can-Bus.

Main features:

- Power supplies: +24Vdc
- Maintains data and programs even in the event of a power out.
- 1...4 axes STEPPER, DC OR BRUSHLESS
- PID control algorithm and programmable feedforward action.
- Point to point positioning, linear interpolation, circular interpolation
- Programmable velocity profiles
- Encoder feedback, even for stepper motors
- 16 in and 8 out that can be handled sequentially or in PLC logic (optional), expandable to 128+128 using industrial Can-Bus.
- Programming language: ISO (extended) for the axes control section, AWL (in the PC) for the PLC section.
- Fast input for acquisition of the axes co-ordinates (touch probe)
- Auxiliary analogue inputs (max. 8)
- Handling the program "Variables"
- Serial port (definable as RS232/422/485) for connecting the machine control panel "MCP".
- 4 incremental encoders
- Parallel process control
- Interface for DC or BRUSHLESS motor drives: REF ($\pm 10V$ / 16bit), DIR, ENABLE, FAULT
- Interface for STEPPER motor drives: PULSE(800KHZ), DIR, ENABLE, FAULT

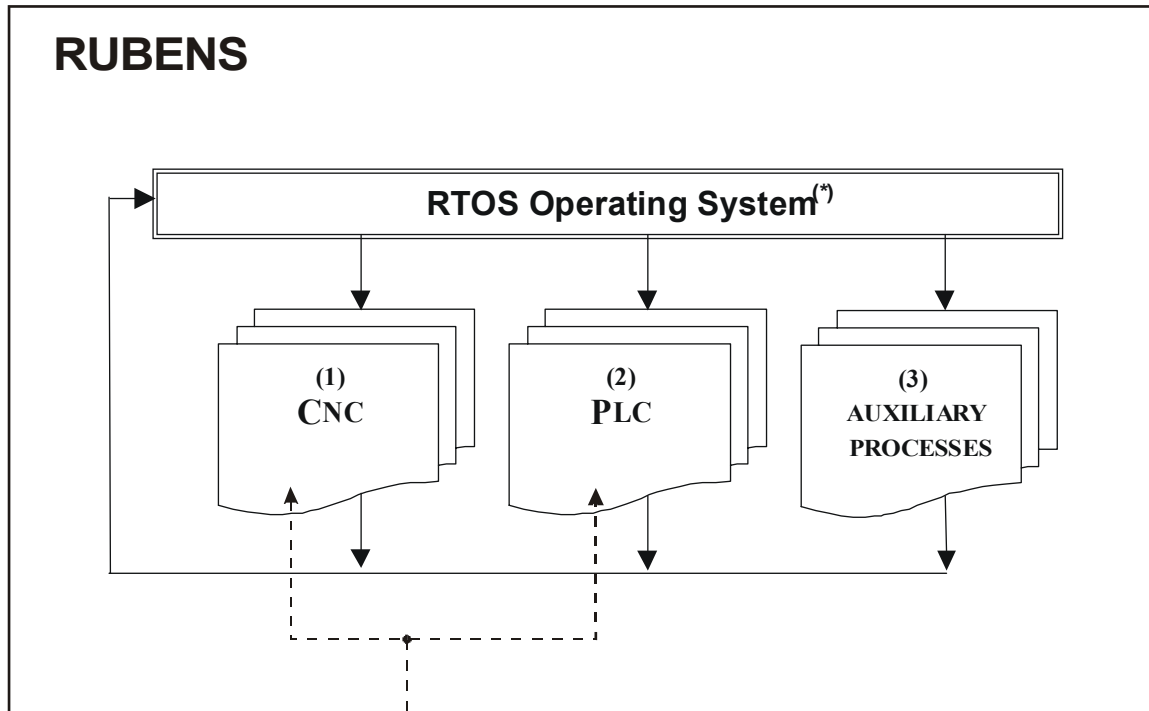

VERSION

The information in this manual refers to the "Rubens Software Version " shown on the cover.

The message showing the software version installed in the Rubens can be read using the %99 instruction.

FIRMWARE GENERAL STRUCTURE

The Rubens has an operating system inside that performs the control of several processes in parallel; in particular the following tasks are executed:

CNC

This is the task for the control of the axes

PLC

This task handles the machine I/O (as PLC section)

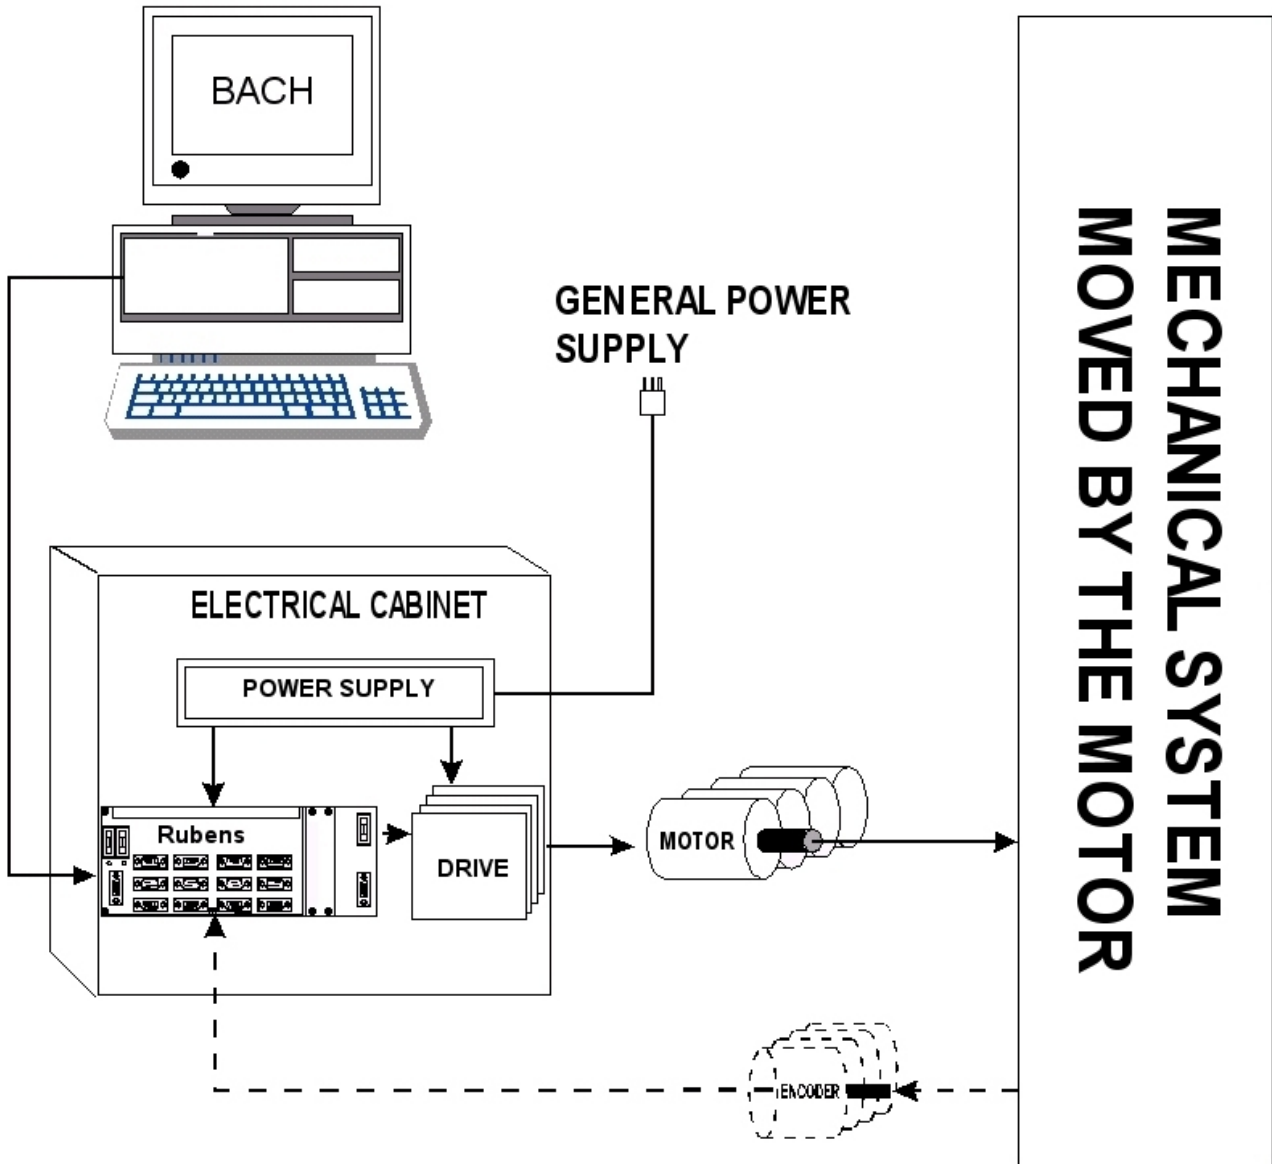

AUXILIARY PROCESSES

Performs the service tasks: communication, error handling, timing, alarms, watchdog, etc.

(*): Real Time Operating System

OPERATION MODE

The operation mode of the Rubens controller can be illustrated by the following drawing, in which the components, that are described later, are divided into groups by function.

- ◆ *Power supply unit:* the group of components that make up the electronics that are used to supply the correct power to the control unit (and other parts of the system). Usually made up of a transformer and the associated protection and manoeuvring devices that must be provided by the user.
- ◆ *Controller:* electronics of the mechanical displacement system that takes care of, together with other parts of the system, the movement along the axes, the electromechanical actuators and any sensors present on the machine.
- ◆ *Drive Unit:* the electronics of a mechanical displacement system that receives and transmits analogue and digital signals from the external controller and drives the motor in such a way that it performs the movements required by the controller
- ◆ *Motor:* is the component, driven by the drive unit, and coupled with the mechanical parts, physically performs the movements along an axis.

- ◆ *Encoder*: is the electronic component that supplies the position information for the mechanical axis (displacement transducer). It may not be used if the system is designed as "open loop" (e.g. with stepper motors).

COMMUNICATION

The Personal Computer can control the (1)Cnc and (2)Plc processes directly, using the BACH support software that enables the operator to: upload/download programs, setup and calibration of the axis parameters, writing/compilation/debugging of the Plc program etc..

CUSTOMISING THE SYSTEM

The @ commands may be used to customise the system by assigning values that differ from those of the default parameters.

- ◆ For a full description of these commands, refer to the manual supplied with the Picasso 2000 board.

INSTALLATION AND CONNECTIONS

UNPACKING

The Rubens package contains the following components:

PROGRAMMING
MANUAL

USERS'
MANUAL

INSTALLATION
AND
CONFIGURATION
OF BACH SOFTWARE

FACTORY
CONFIGURATION
SHEET

BACH
SOFTWARE
INSTALLATION
DISKETTES

CHECKING THE BOARD

Before installing the Rubens controller, check that there are no obvious anomalies. In spite of all the careful checks performed in the factory, it is possible that they can become damaged during the packing or transport. If this is the case, please contact our factory immediately.

PRELIMINARY CONFIGURATION

CONFIGURATION OF THE PC

Check that the number of the serial port (COM) selected for the communication with the PICASSO2000 board is different from serial ports already present on the PC.

If you wish to install the Picasso2000 board on a serial port that is already occupied on the PC, then it is necessary to deactivate the serial port of the PC in the system BIOS.

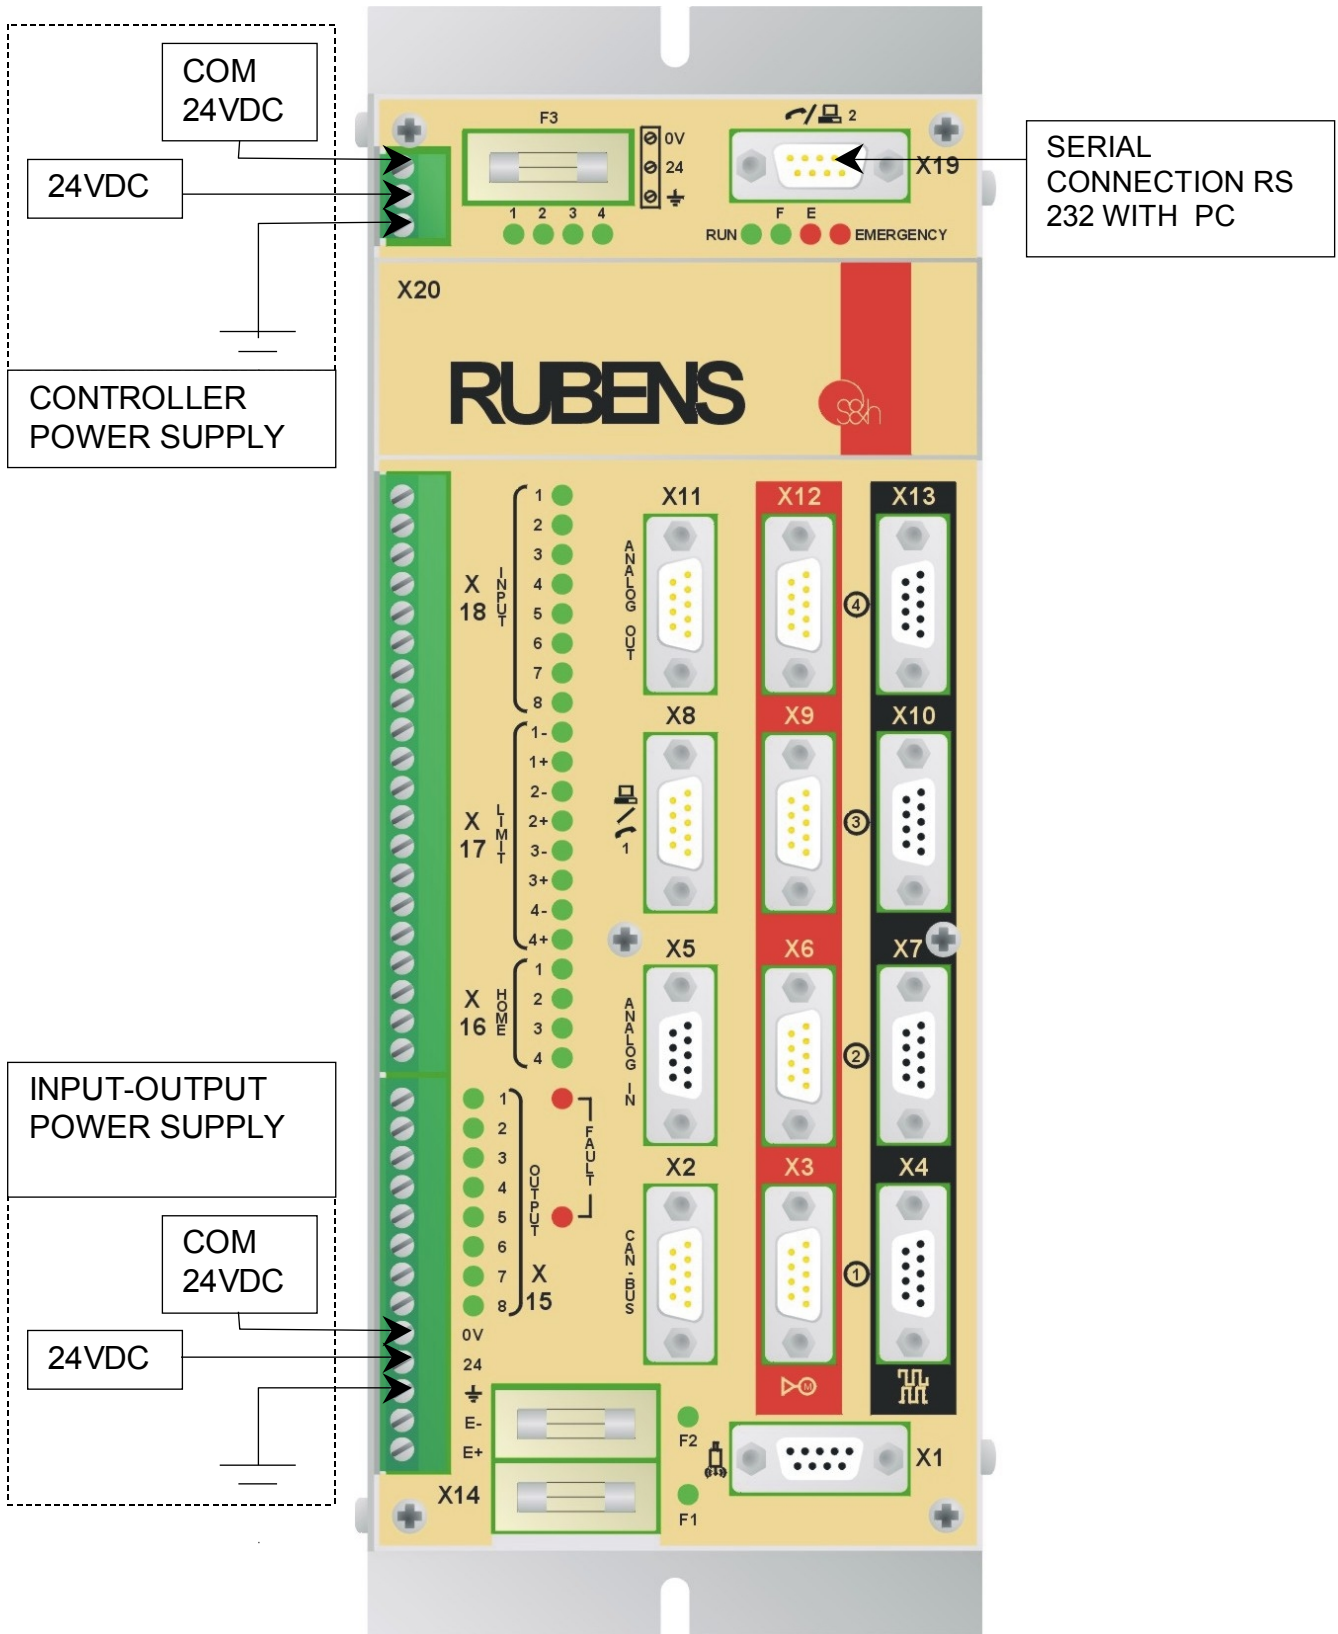

COMMUNICATION SOFTWARE

The BACH program is support software created by S&h.
It is designed to be installed on a PC running Windows 95/98 operating system.

BACH SOFTWARE INSTALLATION AND CONFIGURATION

See the instructions provided.

CONNECTION EXAMPLE

Connect the Rubens controller to the serial port of the PC (COM1 or COM2) using a PC-PC serial cable and configure the port as indicated in the section "Serial link connection".

Power up the controller as indicated in the figure. If the connection is made correctly, the "RUN" indicator on the front of the Rubens will flash for a few seconds and then will become fixed.

At the same time, the "F1" indicator will light up. Although this is not fitted if the encoder has external power supply.

Power up the controller inputs and outputs as shown in the drawing. If the "F2" indicator illuminates, the connection is correct.

Run the BACH program. Click on the connection key. If the connection is not effected automatically, the "Connection" window will appear. Select the Rubens controller and the communication port used. Now it will be possible to communicate with the controller.

8	FA⊖-		8	FA⊖-		8	FA⊖-		8	FA⊖-	
9	FA⊕+		9	FA⊕+		9	FA⊕+		9	FA⊕+	

Notes: The factory default configuration for the encoder is: "DIFFERENTIAL"

"MACHINE ZERO" microswitch (**HOME**)

It is strongly advised to use a "DIFFERENTIAL" type of encoder interface, and it is indispensable if the distance to the encoder exceeds 3 metres or if the environment in which the system operates is subject to electrical interference of any kind.

Use a screened twisted pair cable for the connection to the encoder. The screen must be isolated and connected to ground only to the casing of the connector at the controller end. Furthermore, the screen connections must be made as close as possible to the connector casing.

Maximum encoder input frequency for the RUBENS is of 800KHz (with internal RUBENS multiply we have 800_x_4=3200Khz real counting frequency)

ENCODER SUPPLY

The supply for the encoder can be taken from the RUBENS power supply or supplied from an external power source.

- **ENCODER SUPPLY: FROM THE RUBENS**
In this case, the supply that can be used for the encoder is **+5Vdc**, the maximum current is 100mA.

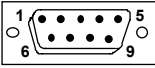

- **ENCODER SUPPLY: FROM AN EXTERNAL POWER SUPPLY**
In this case the encoder supply must be provided by an independent power supply, external to the PC, and connected to terminals 42 and 43 (X14 –4,5).

CONNECTION OF THE PROXIMITY SWITCH

CAN-BUS CONNECTION

The termination resistances (120Ω) are placed at the beginning, in the connector to the CNC, and the end of the cable (see figure).
The devices connected in intermediate positions do not require a termination resistance.

Belden type 3082A or equivalent cable is recommended.

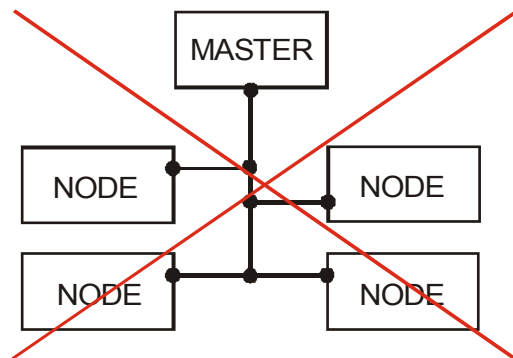

The screen must be connected to the casing of the connector.

INSTALLATION RECOMMENDATIONS

1. The network units must be connected in cascade.
2. Avoid completely any star or tree topography for the connections (see the following figure).

**PERMITTED
CONFIGURATION**

**FORBIDDEN
CONFIGURATION**

CAN Network Configuration

3. Use the same type of cable for the whole installation (screened, twisted pair)
